Motivation and Research Objective
- This study aims to reduce perioperative phases of care duration by understanding the factors that influence the case duration of each phase or entire duration across pre, intra, and post operative phases.

Perioperative Data
- This study used a patient-level dataset with over 32,000 surgical cases, where timestamps recorded specific start and end times of key activities. Time durations of each step within the preoperative, intra-operative, and postoperative phases are analyzed to identify patterns to improve perioperative efficiency, and reduce phases of care durations.

Preliminary Analysis
- Timestamps relevant to key activities were identified and sequenced in a standard protocol. The sequence was validated by a practitioner.
- Unique cases with the data records that are out of standard protocol were eliminated for the generalizability of analysis.
- A flowchart that specifies the fractions of available records in each activity and the possible flow in each transition of activities was created.
- Hypotheses were formulated and are being tested.

Result Summary

Flowchart for Perioperative Phases

Study Rationale:
Increased proactive communication leads to increased coordination of the surgical team, which in turn leads to shorter procedure duration.

Hypothesis:
Recording Anesthesia Begin Closure (An Begin Closure) leads to shorter overall procedure time.

Note: Anesthesia Begin Closure timestamp indicates when the surgeon announces the beginning of the closure.

Control
- Surgical Service
- DayofWeek
- AnBeginClosure
- PrimarySurgeon
- PatientAge
- AnesthesiaType

Conclusions
- There is moderate significance between procedure duration and Anesthesia Begin Closure.

Future Work
- We need more fine-grained data to be able to control for team familiarity.
- We need more fine-grained data control for on-time completion of procedure.
- We need additional timestamps about the progress of the surgeries.

Acknowledgement
- This research is in support of the multi-institution, multi-department AHRQ grant named RIPCHD.OR (Realizing Improved Patient Care through Human-Centered Design in the Operating Room), led by PI’s Anjali Joseph (PhD, EDAC) and Scott Reeves (MD, MBA, FACC, FASE).
- We also thank our sponsoring organizations for the resources and supports for the implementation of this study.
